

## 2017 Immediacy Index calculation

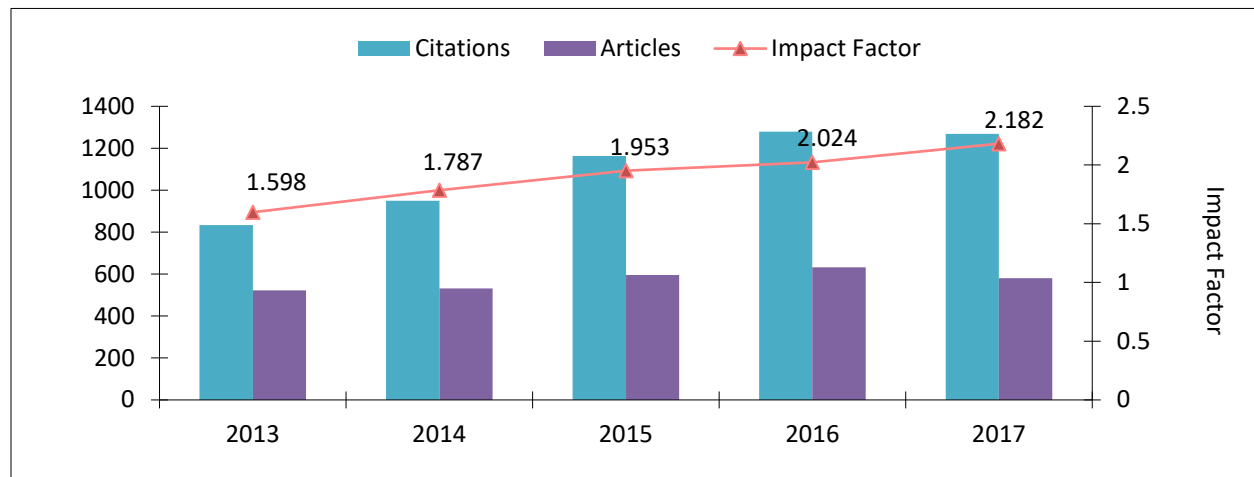

Cites in 2017 to items published in 2017 = 60

Number of items published in 2017 = 309

Calculation:  $\frac{\text{Cites to current items}}{\text{Number of current items}} = \frac{60}{309} = 0.194$

## Impact Factor: 2013- 2017

## Definitions

### Impact Factor

The Impact Factor is calculated by dividing the number of citations in the JCR year by the total number of articles published in the two previous years.

### 5-Year Impact Factor

The 5-Year Impact Factor is calculated by dividing the number of citations in the JCR year by the total number of articles published in the five previous years.

### Immediacy Index

The Immediacy Index is calculated by dividing the number of citations to articles published in a given year by the number of articles published in that year.

### Citable Items

Citable items are articles, proceedings papers, and reviews. An item is classified as a review if it meets any of the following criteria:

- it cites more than 100 references
- it appears in a review publication or a review section of a journal
- the word review or overview appears in its title
- the abstract states that it is a review or survey

Other items include editorials, letters, news items, and meeting abstracts. These items are not counted in JCR calculations because they are not generally cited.

### Cited Half-life

The Cited Half-life measures the median age of the articles that were cited in the JCR year. Half of a journal's cited articles were published more recently than the cited half-life. Only journals cited 100 or more times in the JCR year have a cited half-life.

### Citing Half-life

The Citing Half-life is the median age of articles cited by the journal in the JCR year. Only journals that publish 100 or more cited references have a citing half-life.

### Eigenfactor Metrics

The Eigenfactor™ Score and Article Influence™ Score use citation data to assess and track the influence of a journal in relation to other journals. You can learn more about these metrics at [www.eigenfactor.org](http://www.eigenfactor.org).

### Eigenfactor Score

The Eigenfactor Score calculation is based on the number of times articles from the journal published in the past five years have been cited in the JCR year, but it also considers which journals have contributed these citations so that highly cited journals will influence the network more than lesser cited journals. References from one article in a journal to another article from the same journal are removed, so that Eigenfactor Scores are not influenced by journal self-citation.

### Article Influence Score

The Article Influence determines the average influence of a journal's articles over the first five years after publication. It is calculated by dividing a journal's Eigenfactor Score by the number of articles in the journal, normalized as a fraction of all articles in all publications. The mean Article Influence Score is 1.00.
